Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Truncated erythropietin receptor causes dominantly inherited benign

Truncated erythropoietin receptor causes dominantly inherited benign

E. Droc. Natl. Acad. Sci. U.S.A. 90:4455-4499(1993)

C. I. FUNCTION: Receptor for erythropoietin. Mediates erythropoietin-

C. Induced erythroblast proliferation and differentiation. Upon EPO

C. Induced erythroblast proliferation and differentiation. Upon EPO

C. I. FUNCTION: Receptor EPOR timesing the JAK2/STAT5 signaling

C. I. FUNCTION: Isoform EPOR-T, missing the cytoplasmic tail, acts as a

dominant-negative receptor of EPOR-mediated signaling.

C. I. FUNCTION: Isoform EPOR-T, missing the cytoplasmic tail, acts as a

dominant-negative receptor of EPOR-mediated signaling.

C. SUBUNIT: Forms homodimers on EPO stimulation. The tyrosine-

phosphorylacted form interacts with several SH2 domain-containing

proteins including LYN (By similarity), the adapter protein APS,

C. FYA-45 and inhibits signaling through the DAK-STAT signaling.

C. Shading to PPIPUL, preferentially through the N-terminal SH2

C. Shading to PPIPUL, preferentially through the N-terminal SH2

C. Shading to PPIPUL, preferentially through the N-terminal SH2

C. Shading to PPIPUL, preferentially through the N-terminal SH2

C. Shading to PPIPUL, preferential and phosphorylation of PIPULL

C. Call-warface expression (By similarity). Interaction of PIPULL

C. Call-warface expression (By similarity). Interaction of Coll-warface.

C. Call-warface expression (By similarity).

Domest. Anim. Endocrinol. 19:25-38(2000).
-!- FUNCTION: Receptor for erythropoietin. Mediates erythropoietin-
induced erythroblast proliferation and differentiation. Upon EPO stimulation, EPOR dimerizes triggering the JAK2/STATS signaling cascade. In some cell types, can also activate STATI and STATI.
May also activate LYN tyrosine kinase (By similarity).
-!- SUBUNIT: Forms homodimers on EPO stimulation. The tyrosine-
phosphorylated form interacts with several SH2 domain-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi;

proteins including LYN, the adapter protein APS, PTPN6, PTPN11, JAK2, PI3 kinaese, STATSA/B, SOCS3 and CRKL. The N terminal SH2 domain of PTPN6 binds Tyr-455 and inhibits signaling through dephosphorylation of JAK2. APS binding also inhibits the JAK-STAT signaling. Binding to PTPN11, preferentially through the N-terminal SH2 domain, promoces mitogenesis and phosphorylation of PTPN11. Binding of JAK2 (through its N-terminal) promoces cellsurface expression. Interaction with the ubiquitin ligase NOSIP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Containing phosphateses.

PTM: On EPO stimulation, phosphorylated on C-terminal tyrosine residues by JAK2. The phosphotyrosine motifs are also recruitment sites for several SH2-containing proteins and adapter proteins which mediate cell proliferation. Phosphorylation on Tyr-455 is required for PTPM interaction, Tyr-427 for PTPM11. Tyr-427 is preferred binding site (By similarity).

PTM: Ubjquitinated by NOSIP; appears to be either multimonoubjquitinated by NOSIP; appears to be either multimonoubjquitinated or polyubjquitinated. Ubjquitation mediates SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DOMAIN: Contains 1 copy of a cytoplasmic motif that is referred to
as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This
motif is involved in modulation of cellular responses. The
phosphorylated ITIM motif can bind the SH2 domain of several SH2-
                                                                                                                                                                                                                                                                                                                            Bimilarity).

SUBCELLUIAR LOCATION: Type I membrane protein.

DEVELOPMENTAL STAGE: Low expression at day 24 gestation in fetal liver. Expression increases dramatically thereafter to day 30. Levels then remain constant up to day 40. Levels then remain constant up to day 40. Levels then remain constant up to be necessary for proper protein folding and thereby efficient intracellular transport and cellsurface receptor binding.

DOMAIN: The box 1 motif is required for JAK interaction and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Box 1 motif.
APS binding, and STATS binding and activation (By similarity).
Required for STATS/PTPN11/SOCS3 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Glycoprotein, Phosphorylation, Receptor, Signal, Transmembrane, Ubl conjugation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (By

Isold=P14753-2; Sequence=VSP 009512, VSP 009513;
Isold=P14753-2; Sequence=VSP 009512, VSP 009513;
-1- TISSUE SPECIFICITY: Expressed in relatively mature erythroid progenitor cells and in EPO-responsive erythrolaukemia cells.
-1- DOMAIN: The WSXWS mocif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cellsufface receptor binding is required for JAK interaction and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MDKLRVPLWPRVGPLCLLLAGAAWAPSPSLPDPKFESKAALLASRGSEELLCFTQRLEDL

Mediates erythropoietin-
induced erythroblast proliferation and differentiation. Upon EPO
stimulation, EPOR dimerizes triggering the JAK2/STATS signaling
cascade. In some cell types, can also activate STAT1 and STAT3.
May also activate LYN tyrosine kinase (By similarity).
-!- SUBMNIT: Forms homodimers on EPO stimulation. The tyrosine-
phosphorylated form interacts with several SH2 domain-containing
proteins including LYN, the adapter protein APS, PTPN6, PTPN1,
JAK2, PI3 kinases, STATSA/B, SOC3 and CRKL. The N-terminal SH2
domain of PTPN6 binds Tyr-453 and inhibits signaling through dephosphorylation of JAK2. APS binding also inhibits the JAK-STAT
signaling. Binding to PTPN11, preferentially through the N-
terminal SH2 domain, promotes mitogenesis and phosphorylation of
PTPN11. Binding of JAK2 (Lircugh its N-terminal) promotes cell-
PTPN11. Binding of JAK2 (Lircugh its N-terminal) promotes cell-
surface expression. Interaction with the ubiquitin ligase NOSIP.
                                                                                                                                                                                 + 10 PSSFEYTILDPSSQLLCPRALPPELPPTPPHLKYLYLVVSDSGISTDYSSGGSQGVHGDS

Prolactin receptor maps to pig chromosome 16.";
Mamm. Genome 8:793-794(1997)
-!- FUNCTION: This is a receptor for the anterior pituitary hormone prolactin (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein (By similarity).
-!- DOMAIN: The WSXWS motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cell-surface receptor binding (By similarity).
-!- DOMAIN: The box 1 motif is required for JAK interaction and/or

The full-length erythropoietin receptor (EPO-R) is given. Extracellular domains are expressed from vector plasmid pGRX-2T as fuelon proteins with glutathione-S-transferase. The domains acod for investigating the structure of the EPO-R and for identifying factors involved in regulating differentiation and proliferation mechanisms in erythroid progenitor ells. They can also be used for identifying and quantitating EPO and EPO-R as well as in understanding haematopoietic malignancy and some cardiovascular system disorders. Treating a condition that benefits from modulating regulatory or effector T cell function comprises administering an agent that modulates the expression or activity of a gene or polypeptide (e.g. PTGER2, TGFbetal,
                                                                                                                   420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to treating a subject having a condition that benefits from modulating the balance of regulatory T cell function relative to effector T cell function, or vice versa, in a subject. The method involves administering an agent that modulates the expression or activity of a molecule selected from PTGER2 and TGFDeta1, or Jagged-1, GPR-32, CD83, CD84, CD89, serotonin R, BY55, serotonin R2C, GPR63, histamine R-H4, GPR58, EPO-R, PSG-1, PSG-3, PSG-6, PSG-9, PDE-4d, and PI-3-related kinase to the subject, such that treatment occurs. The methods are useful for diagnosing, preventing or treating conditions

The receptor polypeptide may be used in purification and detection of erythropoietin, and in production of antibodies for anemia therapy. The polypeptide may also be used for treating individuals who are hypersensitive to erythropoietin or who have elevated erythropoietin levels. They may be used in therapy of e.g. primary or secondary proliferative polycythemia. (Updated on 25-MAR-2003 to correct PF field.)

cell response to antigens associated with the condition, such as in an allergic response, an autoimmune disorder, a viral infection, a microbial infection, a parasitic infection or a tumour. The present sequence represents a human erythropoletin receptor (EPOR), preferentially expressed in regulatory T cells.

                                                                                                                                                                                                                                                                                                                              The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic shelt, lung, bone marrow or stem cell transplant rejection, xenotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatof arthritis, lupus, inflammatory bowth diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180

polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central mervous system, melanoma and leukaemia. TAT nucleic acids may further be nervous system, melanoma and leukaemia. TAT nucleic acids may further be polypeptides, and their related nucleic acids. The TAT polypeptides are, overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and gene therapy. The present sequence invention relates to human tumour-associated antigenic target used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequen represents a TAT polypeptide of the invention

New purified human erythropoietin receptor polypeptide, useful for studying ligand binding to erythropoietin receptor, as well as for analyzing and understanding receptor structure and signal transduction.

Example 1; Page 11-12; 19pp; English.

The present invention describes a purified human erythropoietin (EPO) receptor polypeptide, which consists essentially of amino acids 25-250 of the full length human EPO receptor protein. The human EPO receptor polypeptide is capable of binding human erythropoietin. Also described is a purified fusion protein comprising essentially of: (a) a first

 segment having a thrombin protectivic cleavage site at the carboxyl terminus; and (b) a second polypeptide segment consisting essentially of the purified human EPO receptor, where the second polypeptide segment is covalently coupled to the carboxyl terminus of the first polypeptide segment. The human EPO receptor polypeptide is useful for studying ligand binding to the EPO receptor and for quantitating the amounts of the EPO receptor and for quantitating the amounts of the EPO receptor and for guantitating the amounts of the EPO receptor structure and signal transduction. The present sequence represents human EPO receptor from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                        240

                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human NOVX polypeptides and the polynuclectides encoding them. The NOVX polypeptides and polynuclectides are useful for determining the presence of or predisposition to a disease associated with altered levels of the sequences in a mammalian subject, and for treating or preventing a pathology associated with NOVX. The polypeptides, polynucleotides and antibodies that bind immunospecifically to the polypeptides are useful for treating or preventing disorders or syndromes such as congenital heart defects, cardiomyopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, virucide, antibacterial, fungicide, protozoacide, nootropic, neuroprotective, antibarkinsonian, anticonvulsant, osteopathic, antiarthritic, antinflammatory, polypeptides, nucleic acid molecules and antibodises may be useful for treating or diagnosing diseases including metabolic disorders such as diabetes and obesity, infectious diseases, anorexia, cancer, cardiovascular disorders including hypertension and atherosclerosis, neurodegenerative disorders each as Alzheimer's disease, Parkinson's disease and epilepsy, immune disorders e.g. osteoarthritis, haemopoietic disorders, inflammatory skin disorders e.g. osteoarthritis, haemopoietic disorders, inflammatory skin disorders e.g. osteoarthritis, haemopoietic disorders, inflammatory skin disorders asthma and dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Purthermore, the nucleic acids and polypeptides may also be used to identify molecules that modulate or inhibit neurogenesis, cell differentiation and proliferation, haemopoiesis, wound healing and angiogenesis, as well as in gene therapy. Finally, the nucleic acids may be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of
                                                                                                                                                                                             New isolated NOVX polypeptides and polynuclectides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.

Recombinant DNA encoding erythropoietin receptor - used to develop prods. for study, treatment or diagnosis of disorders in which receptor is dysfunctional.

WPI; 1994-025409/03.

N-PSDB; AAQ53995

Disclosure, Fig 9; 24pp, English.

or The cDNA was used to transfer COS-1 cells and these were greened for tadioiodinated erythropoietin (EPO) binding to isolate cDNA encoding the EPO receptor. This cDNA was used as a probe to screen a human genomic cDNA library to obtain DNA encoding the human EPO receptor. The cDNA may be used to study, treat or diagnose disorders in which the EPO receptor is dysfunctional. The EPO receptor may also be used to raise antibodied or for treating hypersensitivity to EPO or who have elevated levels of EPO. The pord, is pref. used for treating anaemias, primary proliferative polycythemia and secondary polycythemia. See also AAR47517. (Updated on 25-MAR-2003 to correct PF field.) Mouse erythroleukaemia (MEL) cells were used to construct a cDNA library

The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, virucide, antibacterial, fungicide, protozoacide, noctropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antiinflammatory, dermatological, antiasthmatic and antilipsemic activities. The anticonvulsant, osteopathic, antiarthritic, antiinflammatory, dermatological, antiasthmatic and antilipsemic activities. The color of diapetic acid molecules and antilodism may be useful for treating or diagnosing diseases including metabolic disorders such as diabetes and obesity, infectious diseases, anorexia, cancer, cardiovascular diseases including hypertension and atherocolerosis, neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease and epilepsy, immune disorders e.g. osteoarthritis, haemopoietic disorders, inflammatory skin disorders as thma and dyslipidaemia.

Considers, inflammatory skin disorders as neurosementics may also be used to identify molecules that modulate or inhibit neurogenesis, cell differentiation and proliferation, haemopoiesis, wound healing and anglogenesis as well as in gene therapy. Finally, the nucleic acids may be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.

encoding them. The NOVX polypeptides and polynucleotides are useful for determining the presence of or predisposition to a disease associated with altered levels of the sequences in a mammalian subject, and for treating or preventing a pathology associated with NoVX. The polypeptides, polynucleotides and antibodies that bind immunospecifically to the polypeptides are useful for treating or preventing disorders or syndromes such as congenital heart defects, cardiomyopathy, atherosclerosis, hypertension, pulmonary stenosis, scleroderma, adenocardinoma, haemophilia, graft-versus-host disease, cancer, multides and sequences. Parkinson's disease, miltides.

New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections

Claim 1; SEQ ID NO 48; 447pp; English.

The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, ancrectic, cardiant, hypotensive, antiateriosclerotic, virucide, antibacterial, fungicide, protozoacide, noctropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, anciarthritic, antiinflammatory, dermatological, antiasthmatic and antilipaemic activities. The polypeptides, nucleic acid molecules and antibodies may be useful for treating or diagnosing diseases including metabolic disorders such as diabetes and obesity, infectious diseases, anorexia, cancer, cardiovascular diseases including hypertension and atherosclerosis, neurodegenerative disorders such as Alzhelmer's disease, Parkinson's disease and epilepsy, immune disorders e.g. osteoarthritis, haemopoietic disorders, inflammatory skin disorders, asthma and dyslipidaemia. Furthermore, the nucleic acids and polypeptides may also be used to identify molecules that modulate or inhibit neurogenesis, cell WO2003040330-A2.

        differentiation and proliferation, haemopoiesis, wound healing and angiogenesis, as well as in gene therapy. Finally, the nucleic acids may be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.

The invention relates to a novel isolated NOVX polypeptide. The cardiant, hyporensive, antiatreriosclerotic, virucide, antibacteric, cardiant, hyporensive, antiatreriosclerotic, virucide, antibacterial, cardiant, hyporensive, antiatreriosclerotic, virucide, antibacterial, fungicide, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antilipace, antiparkinsonian, demnatological, antisathmatic and antilipace activities. The colypeptides, nucleic acid molecules and antibodies may be useful for treating or diagnosing diseases including metabolic disorders such as diabetes and obesity, infectious diseases, anorexia, cancer, cardiovascular diseases including hypertension and atherosclerosis, cardiovascular diseases including hypertension and atherosclerosis, cardiovascular disorders such as Alzheimer's disease, Parkinson's disease and epilepsy, immune disorders e.g. osteoarthritis, haemopoletic disorders, inflammatory skin disorders, asthma and dyslipidaemia.

C'Ruthermore, the nucleic acids and polypeptides may also be used to identify molecules that modulate or inhibit neurogenesis, cell differentiation and proliferation, haemopolesis, wound healing and angiogenesis, as well as in gene therapy. Finally, the nucleic acids may be used as hybridisation probes, in chromosome mapping, tissue typing, the human NOW yorkers of the current sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the human NOV protein of the invention

The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The NOVX polypeptides and polynucleotides are useful for determining the presence of or predisposition to a disease associated with altered levels of the sequences in a mammalian subject, and for treating or preventing a pathology associated with NOVX. The polypeptides, polynucleotides and antibodies that bind immunospecifically to the polypeptides are useful for treating or preventing disorders or syndromes such as congenital heart defects, cardiomyopathy, atheroselerosis, hypertension, pulmonary stenosis, scleroderma, adenocarcinoma, haemophilia, graft-versus-host disease, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   multiple sclerosis, diabetes, obesity, bronchial asthma, acquired immunodeficiency syndrome (ALDS), Crohn's disease, infectious disease, anorexia and immune disorders. This sequence represents a human NOVX polypeptide of the invention. Note: The sequence data for this patent is
                                                                                                                                                                                                Novel isolated NOVX polypeptide useful treating or preventing disorders or syndromes such as Alzheimer's disease, Parkinson's disease, multiple sclerosis, diabetes, obesity, cancer, bronchial asthma, Crohn's disease.

Submitted (20-JUL-2004) Genoscope - Centre National de Sequencage : BP 191 91006 EVRY cedex - FRANCE (E-mail : segref@genoscope.cns.fr - Web : www.genoscope.cns.fr) a Nobe : www.genoscope.cns.fr) a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pcMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.
                                                                                                                                                                                                                                                                                                              HTC 21-JUL-2004

184 strand cDNA was primed with a Not1-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pOMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.

18. strand cDNA was primed with a NotI-oligo(dT) primer. Five prime

18. end enriched, double-strand cDNA was digested with Not I and cloned

19. into the Not I and Econ V sites of the pCMVSPORT 6 vector. Library

19. was normalized. Library was constructed by Life Technologies, a

19. division of Invitrogen. This sequence belongs to sequence cluster

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
